**PLC** 

#### Test 2

- Notes on the submission file:
  - There are 7 files: 4 .txt test files, 1 code file Lex\_Parse.py, 1 readme file (this one), and 1 PDF of the LR(1) parse table.
  - Lexer and Parser code are both in 1 file called Lex\_Pase.py.
  - Only run Lex\_Parse.py
  - Choose test file to run by changing the hard coded path in run time code:

```
390 #token list created
391 mytokens, lex_stat = mylex.tokenize("no_error_test1.txt")
```

Choose the test file by typing the file name in the tokenize function

PART A: Define Token rules (using Regex)

Token name	Regex rule	Token name	Regex rule
case_key:	case	module:	%
itr_key:	itr	assign:	=
other_key:	other	EQ:	==
times_key:	times	NEQ:	!=
int_key:	nat	LT:	<
lit_int8b:	0 -?[1-9])[0-9]*	GT:	>
lit_int8b	0 -?[1-9])[0-9]*_b8	LTE:	<=
lit_int4b	0 -?[1-9])[0-9]*_b4	GTE:	>=
lit_int2b	0 -?[1-9])[0-9]*_b2	L_paren:	\(
lit_int1b	0 -?[1-9])[0-9]*_b1	R_paren:	\)
var_name:	[a-zA-Z_]{1,7}	L_bracket:	/[
end_stmt:	\.	R_bracket:	\J
declare_var:	var	BEGIN:	BEGIN
add:	\+	END:	END
subtract:	-		
multiply:	\*		
divide:	/		

Section B: define production rules

```
::= BEGIN <Statement_list>
<Start>
<Statement_list> ::= <Statement> <Statement_list>
                      | END
<Statement> ::= nat <Var_decl>
          | case <Case>
          | itr < ltr>
          | var_name <Var_assign>
<Var_decl> ::= var_name "."
<Var_assign> ::= "=" <Math_expr>
<Case> ::= <Boolean_expr> "[" <If_true> other "[" <If_false> "."
<Boolean_expr> ::= "(" <Number> <Rela_op> <Number> ")"
<Rela_op> ::= ">" | "<" | "==" | "!=" | "<=" | ">="
<lf_true> ::= <Statement> <lf_true> | "]"
<If_false> ::= <Statement> <If_false> | "]"
<Itr> ::= <Number> times "[" <To_repeat> "."
<To_repeat> ::= <Statement> <To_repeat> | "]"
```

```
<Math expr> ::= <sum>
<Sum> ::= <Mul> "+" <Sum>
    | <Mul>
<Mul> ::= <Div> "*" <Mul>
    | <Div>
<Div> ::= <Subtr> "/" <Div>
    | <Subtr>
<Subtr> ::= <Mod> "-" <Subtr>
     | <Mod>
<Mod>::= <Factor> "%" <Mod>
    | <Factor>
<Factor> ::= "(" <Math_expr> ")"
    | <Number>
<Number> ::= lit_int8b
      | lit_int4b
      | lit_int2b
      | lit_int1b
      | var_name
```

- Notes on production rules:
  - var\_name is any var\_name token
- 6 levels of precedence in math expressions (Low to High):
  - 1. Sum
  - 2. Multiply
  - 3. Divide
  - 4. Subtract
  - 5. Module
  - 6. Parentheses

#### PART C: PROVE RULE SET CONFORM TO LL

My production rules conform to LL because it does not have left hand recursion and it passes the pairwise disjointness test.

- No left hand recursion:
  - In my grammar, there are 4 non-terminals that uses recursion (<Statement\_list>, <If\_true>, <If\_false>, <To\_repeat>). However, each of these rules have an alternatives that contains only one terminal symbol. Those terminal symbols would stop the recursion (like a base case). In all cases, there is no left hand recursion.
  - In my mathmetical\_expression Non-terminal symbol <math\_expr>, there is
     recursion being used but it does not lead to indirect left hand recursion in any case.
- Pass the pairwise disjointness test:
  - FIRST <Start> ::= {BEGIN}
  - FIRST <Statement list> ::= {nat, case, itr, var name, END}
  - FIRST <Statement> ::= {nat}, {case}, {itr}, {var name}
  - FIRST <Var decl> ::= {var name}
  - FIRST <Var assign> ::= {"="}
  - FIRST <Case > ::= {"(")}
  - FIRST <Boolean expr> ::= {"(")
  - FIRST <Rela op> ::= {">"}, {"<"}, {"=="}, {"!="}, {"<="}, {">="}
  - FIRST <If true> ::= {nat, case, itr, var name}, {"]"}
  - FIRST <If false> ::= {nat, case, itr, var\_name}, {"]"}
  - FIRST < Itr> ::= {lit int8b}, { lit int4b }, {lit int2b }, { lit int1b }, {var name}
  - FIRST <To repeat> ::= {nat, case, itr, var name}, {"["}
  - FIRST <Math expr> ::= {"(", {lit int8b, lit int4b, lit int2b, lit int1b, var name}}
  - FIRST <Sum> ::= {"(", {lit int8b, lit int4b, lit int2b, lit int1b, var name}}
  - FIRST <Mul> ::= {"(", {lit\_int8b, lit\_int4b, lit\_int2b, lit\_int1b, var\_name}}
  - FIRST <Div> ::= {"(", {lit int8b, lit int4b, lit int2b, lit int1b, var name}}

#### PART C (PAGE 2)

- FIRST <Subtr> ::= {"(", {lit\_int8b, lit\_int4b, lit\_int2b, lit\_int1b, var\_name}}
- FIRST <Mod> ::= {"(", {lit\_int8b, lit\_int4b, lit\_int2b, lit\_int1b, var\_name}}
- FIRST <Factor> ::= {"(", {lit\_int8b, lit\_int4b, lit\_int2b, lit\_int1b, var\_name}}}
- FIRST <Number> ::= {lit\_int8b}, { lit\_int4b }, {lit\_int2b }, { lit\_int1b }, {var\_name}
- → Because there are no matching terminal symbols in each of the non terminals' FIRST sets (the alternatives of each non-terminal is disjoint), these grammar rules passes the pairwise disjointness test

## PART D: PROVE GRAMMAR IS UNAMBIGUOUS

 My grammar is not ambiguous because It passes the pairwise disjointness test and because It is not possible to generate a string that has more than one parse tree in this grammar.

#### PART E: LEXICAL ANALYZER

The lexical analyzer should:

- Recognize all tokens
- Produce a list of those tokens
- Print error message for lexical error
- Be object-oriented
- Have comments

Example 1: test file with no errors

#### Output:

```
Lexical error: No
Syntax error: Yes
token list:
[BEGIN:BEGIN,
nat:int_key,
a:var_name,
a:var_name,
 =:assign,
1:lit_int8b,
+:add,
 (:L_paren,
2:lit_int8b,
%:module,
3:lit_int8b,
):R_paren,
 .:end_stmt,
 END: END]
```

The lexical analyzer recognized all tokens in the test file, produced a complete list of those tokens, confirmed that there were no lexical errors

Code snippet of lexical analyzer:

This tells us that the lexical analyzer is object-oriented and it has comments for its function

Test file with lexical error:

```
1 BEGIN
2
3 nat &&}
4
5 END
6
```

Its output:

```
[Running] python -u "d:\Coding\Python files\PLC\Exam
BEGIN

nat &&}
END

Lexical error: &&} at index: 2 (invalid lexeme)
```

This shows that the Lexer will print an error message when there is a lexical error.

#### PART F: SYNTACTICAL ANALYZER

My program only tells the user if there is a syntax error, it does not outut a specific error message for most errorss

#### Examples:

• Test file with correct syntax:

```
BEGIN

nat a .

a = 13 - ( 3 % ( 8 / 2 ) - 50 ) .

nat b .

b = 0 .

itr 5 times [ b = b + 1 . ] .

END
```

• Its output:

```
nat a .
a = 13 - (3 % (8 / 2) - 50) .
nat b .
b = 0 .
itr 5 times [ b = b + 1 . ] .

END

Lexical error: No
Syntax error: No
```

This means that the variable declaration, the mathematical expression, the variable initialization, and the itr loop are all in the correct grammar.

• Test file with syntax error in itr loop (missing brackets):

```
1 BEGIN
2
3 nat a .
4 a = 13 - (3%(8/2) - 50).
5 nat b .
6 b = 0 .
7 itr 5 times b = b + 1 .
8
9 END
10
```

• Its output:

```
nat a .

a = 13 - (3 % (8 / 2) - 50) .

nat b .

b = 0 .

itr 5 times b = b + 1 .

END

Syntax error: "[" expected Lexical error: No Syntax error: Yes
```

This shows that the syntax analyzer can find the correct syntax error in the text file

No\_error\_test1.txt:

```
Lexical error: No
Syntax error: No
token list:
[BEGIN: BEGIN,
nat:int_key,
a:var_name,
 .:end_stmt,
nat:int_key,
b:var_name,
 .:end_stmt,
a:var_name,
 =:assign,
13_b1:lit_int1b,
 .:end_stmt,
b:var_name,
 =:assign,
a:var_name,
 +:add,
 7:lit_int8b,
 -:subtract,
 2:lit_int8b,
 *:multiply,
 3:lit_int8b,
 +:add,
 (:L_paren,
 a:var_name,
 -:subtract,
 10:lit_int8b,
 *:multiply,
 (:L_paren,
 a:var_name,
 *:multiply,
 2:lit_int8b,
 ):R_paren,
 ):R_paren,
 .:end_stmt,
END: END]
```

• Its output:

#### No\_error\_test2.txt:

#### • Its output:

```
Lexical error: No
                        ):R paren,
Syntax error: No
                        [:L bracket,
                        itr:itr_key,
token list:
                       6:lit int8b,
                        times:times key,
[BEGIN: BEGIN,
                        [:L bracket,
nat:int key,
                       a:var name,
a:var name,
                       =:assign,
                                           count:var_name,
.:end stmt,
                        a:var name,
                                           =:assign,
nat:int key,
                       +:add,
                                           count:var_name,
b:var name,
                       1:lit int8b,
                                           +:add,
 .:end stmt,
                        .:end stmt,
                                           1:lit int8b,
nat:int key,
                        ]:R bracket,
                                           .:end stmt,
count:var name,
                        .:end stmt,
                                           ]:R bracket,
 .:end stmt,
                       b:var_name,
                                           other:other key,
a:var name,
                       =:assign,
                                           [:L bracket,
=:assign,
                       0:lit int8b,
                                           b:var name,
0:lit_int8b,
                        .:end_stmt,
                                           =:assign,
 .:end stmt,
                        b:var name,
                                           -99:lit int8b,
case:case_key,
                       =:assign,
                                            .:end stmt,
 (:L paren,
                       b:var name,
                                            ]:R_bracket,
 a:var_name,
                        +:add,
                                            .:end_stmt,
==:EQ,
                        a:var_name,
                                           END: END]
 2:lit_int8b,
                        .:end stmt,
```

lex\_test.txt: has 5 lexical errors

- 1. line 3: a. is not a valid variable name (a and "." Need to be separate)
- 2. line 4: \$ is not a token in this language
- 3. line 6: :) is not a token in this language
- 4. line 6: === is not a token in this language
- 5. line 8: @ is not a token in this language
- Its output:

```
Lexical error: a. at index: 2 (invalid lexeme)
```

syn\_test.txt: has 5 syntax errors

```
≡ syn_test.txt

     BEGIN
     aa.
     nat b = 10.
     nat 30 .
     a = 0.
     case a == 2 [ itr 6 times [ a = a + 1 . ] .
                       b = 0
                       b = b + a.
11
                       count = count + 1.
12
13
     other [b = -99.].
14
15
     END
```

- 1. line 3: var\_name can only be followed by "=", a a . is not correct for var\_assign
- 2. line 4: nat is first token -> this Is a var\_declaration statement. Var\_declaration does not have "=" or integer literals -> "=" and 10 should not be there
- 3. line 5: nat is first token -> this Is a var\_declaration statement. Token nat can only be followed by a var\_name, not 30.
- 4. line 8: "a == 2" needs to have parentheses, correct syntax is "(a == 2)"
- 5. line 9: This is a var\_assign statement, it needs "." To end the statement.
- Its output:

```
Error: expecting "="
Lexical error: No
Syntax error: Yes
```

#### PART H: LR(1) PARSE TABLE

• The grammar input into the parser generator:

```
S = <Start>, SL = <Statement_list>, ST = <Statement>,

VD = <Var_decl>, VA = <Var_assign>, C = <Case>,

BE = <Boolean_expr>, O = <rela_op>, T = <lf_true>,

F = <lf_false>, I = <ltr>, RP = <To_repeat>,

ME = <Math_expr>, SUM = <Sum>, MUL = <Mul>,

DIV = <Div>, SUB = <Subtr>, MOD = <Mod>,

FAC = <Factor>, N = <Number>, int = {lit_int1b, lit_int2b, lit_4b, lit_8b}
```

## PART H: (PAGE 2)

# • FIRST table generated:

	FIRST table
Nonterminal	FIRST
s'	{BEGIN}
S	{BEGIN}
SL	{END, nat, case, itr, var_name}
ST	{nat,case,itr,var_name}
VD	{var_name}
VA	{=}
С	{(}
BE	{ (}
0	{>,<,==,!=,<=,>=}
T	{nat,case,itr,var_name,]}
F	{nat,case,itr,var_name,]}
I	{int,var_name}
RP	{nat,case,itr,var_name,]}
ME	{(,int,var_name}
SUM	{(,int,var_name}
MUL	{(,int,var_name}
DIA	{(,int,var_name}
SUB	{(,int,var_name}
MOD	{(,int,var_name}
FAC	{(,int,var_name}
N	{int,var_name}

- This table matches exactly with the pairwise disjoint test performed in part C
